

Kitchen display

The wall screen for the kitchen system: step 1 of the build spec. It's one HTML page with no build step and no framework, and it runs full-screen on a Nexus 6P in Fully Kiosk Browser.

File	What it is
<code>index.html</code>	The whole display: time-of-day modes, weather, restock buttons, cook view
<code>recipes.json</code>	The four hand-written recipes (format from the build spec)
<code>week.json</code>	Stands in for the Google Sheet's <code>week</code> tab until step 2

Screens

Mode	When	Shows
Morning	5–11 am	Weather for the next 12 hours, tonight's dinner and prep note, restock buttons
Day	11 am–4 pm	Tonight's dinner, prep note, restock buttons
Evening	4–9 pm	Tonight's dinner in large type, Start cooking , and a "Keep / Never again" rating once you've cooked (or from 7:30 pm). Tuesday and Thursday say date night.
Night	9 pm–5 am	A dim clock that moves around, plus tomorrow's weather

Start cooking first lists the ingredients, then shows one step at a time. Tap anywhere on the step, or tap Next, to move on. Steps that have a timer get a button that starts a countdown, and it beeps when time is up.

The week plan

Until the Sunday picker exists, `week.json` holds a standing Monday–Thursday plan:

- Mon: Poke Bowls. The fish is eaten raw, so it goes on the night the groceries are freshest.
- Tue: One-Pan Chicken Thighs, Couscous and Boursin
- Wed: Tacos
- Thu: Burgers

To change a single date, add a row to `rows`:

```
"rows": [  
  { "date": "2026-09-29", "recipe_id": "tacos", "prep_note": "" },  
  { "date": "2026-10-01", "recipe_id": "" }  
]
```

An empty `recipe_id` means nothing is planned that night.

What v1 doesn't do yet

Restock taps and ratings are **saved on the phone only**. Step 2 connects them to the Google Sheet through an Apps Script web app, and the ordering agent reads them from there.

Phone setup (Fully Kiosk Browser)

- Start URL: `https://beeharder.github.io/kitchen-display/`
- Turn on: Keep Screen On, Launch on Boot, fullscreen / hide status and navigation bars
- Turn off: screensaver, screen-off timer
- Charge it permanently over USB-C through the wall mount

The page reloads itself at 4 am each day, so changes pushed here reach the phone overnight without anyone touching it.

Built for the phone

- The JavaScript is ES5 only, and the CSS avoids nesting, `:has()`, container queries and `flex gap`, because the phone's browser is old.
- The layout shifts a few pixels every minute and the night screen is dim, to limit AMOLED

burn-in.

- Weather comes from Open-Meteo (no API key), for Kitsilano, Vancouver.
- If a fetch fails, the page keeps showing the last good copy and says it's offline.

Testing on a laptop

Add `?now=` to the URL to pretend it's a different time, for example `index.html?now=2026-09-22T17:30` for Tuesday evening. To try it locally, run `python3 -m http.server` in this folder and open `http://localhost:8000`.
